NC STATE UNIVERSITY

Investigating the Impact of Computational Modeling on Students' **Conceptual Understanding of Force and Motion**

College of Education

Introduction

Problem

- The Next Generation Science Standards (NGSS) identified modeling and computational thinking as part of the eight science and engineering practices (Lead States, 2013).
- Advances in computing and information technologies have further emphasized the centrality of modeling in science by making model building more accessible to scientists today (Schwarz & White, 2015).
- Previous research shows that most students do not engage in model building activities in K-12 formal classroom settings (Schwarz & Gwekwerere, 2007).

Research Questions

- 1. How does building simulation-based computer models of physical phenomena through a visual programming environment in a week-long classroom intervention influence middle school students' conceptual understanding of force and motion concepts?
- 2. Is there a differential impact of the classroom intervention on students' conceptual understanding of force and motion concepts according to students' gender?

Method

Theoretical Framework

• The Representational Construction Affordances (RCA) framework (Prain & Tytler, 2012) explains how and why students learn through generative activity of constructing their own representations.

Participants

- This study took place in a public middle school. The sample consisted of seventh-grade students (N = 82).
- 54% of the students were male.
- The age of the students varied from 12 to 14 years with an average of 12.69 (SD = .52).

Data Sources and Analysis

- Data sources included a pre- and post-test of a 16-item Force and Motion multiple choice assessment, and structured interviews with a subset of the participating students (n = 12).
- A paired samples t-test was conducted to determine if there were any statistically significant differences between students' pre- and post-test scores. Audio recordings of students' interview responses were transcribed verbatim and qualitatively analyzed by two researchers using open coding approach to identify the emergent themes (Creswell, 2015).
